PREFACE

Because OINE VIII contains a large amount of material it was necessary to divide it into two parts. *Part 2, Registers and Plates*, consists of the registers of objects found in Cemetery Q (*Appendix C*), Cemetery B (*Appendix D*), and the Ballana Settlement (*Appendix E*), as well as the plates for this volume.

Many of the tombs and their contents listed in *Appendices C* and *D* are identified with one of the following designations:

1. "Key group" indicates that the location and context of the tomb are credible (i.e., the tomb was not reused at a date remote from its construction). A key group tomb is important because the tomb was constructed for the initial burial. Key group tombs help to establish the various areas of the cemetery.
2. "Type group" indicates a group of material which was probably originally deposited together (i.e., the original deposit in a tomb). Type group tombs are important because they are used to establish the chronological phases of the cemetery.
3. "Key type group" indicates that the location of the tomb and the material in it are credible together. A key type group tomb is both a key group tomb and a type group tomb. Key type group tombs help to establish the chronological sequence of the cemetery.

APPENDIX C

REGISTER OF FINDS IN CEMETERY Q

This register (along with those in *Appendix D* and *Appendix E*) is an extension of the recording on The Oriental Institute Nubian Expedition burial sheets. Apart from essential facts of burial and shape of the tomb (with a simple sketch), the sheet lists objects found in the tomb, generally in order of their discovery. Sheets list complete objects, and a small label identifies each object with a number (for example B 64A—1) and information on the findspot within the tomb which was later used as the basis for describing the provenience in the field register. Proveniences given to individual objects identify the tomb quite clearly, but the original location of scattered fragments within the tomb was often not indicated precisely. The register in 1962–1963 identified objects and samples; sherds were identified only by tomb number and not registered separately and some complete vessels were not registered. In 1963–1964, only objects were registered; material samples and sherds were identified only as coming from a certain locus. In some cases, relatively undistinguished small objects were considered samples. Both types of recording were encountered. Although the individual objects, sherds, and samples were clearly noted by location, entries on some burial sheets, such as “sherd sample taken,” indicate that the recovery of sherds was not complete and was probably haphazard. A number of items were discarded at the end of the season or were left in the tombs. A vehicle accident in 1964 resulted in the mixing of some of the sherds from Cemetery L and also mixed up sherds from the Ballana settlement with some from Qasr el Wizz. Not all of the sherds from these two sites were affected.

Tomb Description: The entry gives the type of deposit, a simplified description, and dimensions as recorded in meters. The heading also includes the date according to the phases presented in *Chapter 1 (Part 1, Text and Figures)*, the cemetery area (in Cemetery Q), or a date that would be indicated by the tomb’s position alone (in Cemetery B). Illustrations are cited in the right-hand column. Most of the tombs had chambers or niches (*loculi*) which were blocked off from the shaft. Many also had superstructures. The descriptive entry therefore includes subdivisions. Some of the superstructures in Cemetery Q were given prefix designations different from the tombs (D). Since it was not always clear which shaft was to be assigned to a given superstructure, these designations are generally retained in the present work.

Burial: The position of the body is given by four entries separated by a ‘/’ that give the (river) direction of the head (toward the N, S, E, W etc.), the basic position (B for back; S, R, or L for side), the position of the legs (almost always extended [ext.]), and the position of the hands.

Body: The age and sex of the body are given as they were recorded by members of the expedition. In 1963–1964, the anthropologist was Duane Burnor. The categories used were infant I and II, juvenile, adult, mature, and senile. In doubtful cases, the categories are hyphenated. Sometimes, an estimate in years or months was indicated.

Objects: Apart from the burial and sherds, the contents of the tomb are listed under the heading “Objects.” In cases where the structure of the tomb was complex or the objects were arranged in some special way, there is a subheading that indicates the location of various objects within the tomb. Important individual objects are listed, generally in the numerical order established in the field. A few objects were added to this list in Chicago, and the numbers were sometimes changed for publication (the key number for any object is the OIM number [Oriental Institute Museum, Chicago] or the field number in those cases where the object was assigned to the Cairo Museum). Each object has a brief verbal descriptive designation, followed by the descriptive codes which are necessary to locate it in the appropriate discussion or table in the text; where the

table is brief, codes are not indicated in the tomb register. Brief descriptive information on decorated pottery is included in the present register with Munsell color readings for selected pieces. Measurements are given for many objects that are not illustrated. Beads are indicated only by tomb and OIM number, having a separate tabular presentation in *Chapter 3 of Part 1, Text and Figures* (tab. 24).

Pottery: Where separate lists of sherds are appended to the tomb entry, they are divided according to major cultural group and individual vessels are indicated by a roman letter, followed by the code that refers to the text. These entries also include remarks on decoration and Munsell color readings.

Tomb complex B 111A–D, 120, 125				fig. 217a
<p>This group of what are now holes consists of two to the S (B 111A, B 120) which appear to be a single tomb with chamber at the W end. In the center, shaft B 111B may have had a chamber on the W end that was destroyed by the construction of B 46, B 111C and B 111D, the latter two N-S oriented shafts with extended burials, probably of late X-Group or Christian date. Tomb B 125, immediately to the N had a brick wall on the S side, and the shaft was probably missed in the course of excavating, probably due to erosion. Alternatively, this hypothetical shaft served for both B 111B, which was then a chamber, and B 125.</p>

APPENDIX E

A MEROITIC SETTLEMENT AT BALLANA

Early in season 1963–1964, the expedition worked in the remnants of a mudbrick settlement directly to the east of Cemetery B. The settlement was buried some two meters in the sand and the excavation was abandoned after a brief operation.

The structures consisted of walls, mostly a single brick thick that probably did not support a second storey (fig. 308). All of the walls but one were more or less straight, and they were sometimes paralleled by additional brick walls, possibly repairs that indicated some duration for the settlement. Only one complete room with a mud floor, a corridor, and part of a second room were found. The floors and a dump yielded quantities of Meroitic potsherds. Below a curved wall north of the preserved room were two simple jars of early Meroitic date, and seven large jars were found set into the floor and left in place. The only other find specifically noted from the settlement was a weathered Meroitic offering table.

The brevity of the excavations, the fragmentary nature of the buildings, and the poverty of the materials do not permit major conclusions. Despite the simplicity of the remains, the pottery clearly belongs to the early part of the Meroitic period, and despite the lack of large-scale exposures, the area definitely contained facilities for production and storage.
